

blinkit Analysis

Sales & Outlet Performance

Power BI Business Intelligence Project Report

Prepared from the supplied PBIX model, project requirements and dashboard view

DEVELOPED BY

MANISH KASHYAP

01 Executive Summary

A decision-oriented view of the supplied Blinkit Power BI dashboard.

TOTAL SALES \$1.20M Overall revenue generated	AVG SALES \$141 Average sales per transaction	NO. OF ITEMS 8,523 Items represented in the dashboard	AVG RATING 3.9 Average customer rating
--	--	--	---

The dashboard is designed to answer four practical questions: how much is being sold, which products and outlet segments drive sales, where sales are concentrated, and how outlet formats compare on operational metrics.

Sales mix Regular-fat products contribute about 64.6% of displayed sales.	Outlet size Medium outlets contribute about 42.3% of displayed sales.	Location Tier 3 locations contribute about 39.3% of displayed sales.
Outlet format Supermarket Type1 contributes about 65.5% of displayed sales.	Product concentration Fruits & Vegetables and Snack Foods are the two largest item-type categories.	Customer signal Average rating is 3.9, providing a useful service-quality benchmark.

02 Project Scope & Business Requirements

The supplied project workflow follows a complete BI life cycle from requirements to actionable insights.

STEP	ACTIVITY	PURPOSE
01	Requirement Gathering	Translate business questions into KPIs and visuals.
02	Data Walkthrough	Understand fields, grain, categories and available measures.
03	Data Connection	Connect the BlinkIT Grocery Data model to Power BI.
04	Data Cleaning / Quality Check	Validate categories, data types, blanks and consistency.
05	Data Modeling & Processing	Prepare the analytical structure and reporting logic.
06	DAX Calculations	Create reusable measures for sales and operational KPIs.
07	Dashboard Layout	Arrange filters, KPI cards and visuals for quick scanning.
08	Chart Development	Build and format charts for segment and trend analysis.
09	Report Development	Combine visuals into an interactive decision-support dashboard.
10	Insights Generation	Turn patterns into business actions and follow-up questions.

Business requirement: conduct a comprehensive analysis of sales performance, customer satisfaction and inventory distribution using KPIs and Power BI visualizations.

03 Data Model & Analytical Structure

The PBIX definition shows a central BlinkIT Grocery Data entity plus a Metrics field-parameter structure used to switch KPI views.

AREA	FIELDS / ROLE
Core entity	BlinkIT Grocery Data
Metric selector	Metrics
Sales measures	Total Sales, Avg Sales
Volume / assortment	No Of Items
Customer signal	Avg Rating
Product dimensions	Item Type, Item Fat Content
Outlet dimensions	Outlet Type, Outlet Size, Outlet Location Type, Outlet Establishment Year
Operational field	Item Visibility

Data-quality focus: before interpreting results, validate numeric fields, category spelling, outlet hierarchy, missing values and the business meaning of each KPI. The report does not assume additional cleaning steps beyond the supplied project workflow.

Analytical grain: the dashboard is built around product and outlet attributes, allowing sales to be sliced by product fat content, item type, outlet size, location tier, outlet format and establishment year.

04 KPI Framework

The dashboard uses a compact KPI layer so users can switch the analytical lens without rebuilding the page.

KPI	Dashboard value	Business question
Total Sales	\$1.20M	How much revenue is represented in the current view?
Avg Sales	\$141	What is the average sales value per transaction?
No. of Items	8,523	How much item-level volume is represented?
Avg Rating	3.9	What is the overall customer rating signal?

Interactive design: the dashboard includes slicers for Outlet Location Type, Outlet Size and Item Type, plus a metric selector that changes the analytical measure used by selected visuals.

Actionability principle: KPI cards tell the reader what is happening; segment charts explain where it is happening; the outlet matrix supports what to investigate next.

05 Product & Sales-Mix Analysis

The dashboard combines fat-content mix with item-type ranking to reveal where sales are concentrated.

FAT CONTENT	SALES	SHARE
Low Fat	\$425.36K	35.4%
Regular	\$776.32K	64.6%

TOP ITEM TYPES	SALES
Fruits & Vegetables	\$0.18M
Snack Foods	\$0.18M
Household	\$0.14M
Frozen Foods	\$0.12M
Dairy	\$0.10M
Canned	\$0.09M
Baking Goods	\$0.08M
Health & Hygiene	\$0.07M
Meat	\$0.06M
Soft Drinks	\$0.06M

Reading the result: regular-fat products account for the larger share of displayed sales, while Fruits & Vegetables and Snack Foods lead the item-type ranking at roughly \$0.18M each. These are useful starting points for assortment, promotion and availability reviews.

Follow-up question: are high-sales categories also delivering stronger ratings, item visibility and average sales, or is revenue concentration masking an operational opportunity?

06 Outlet Size, Location & Establishment Analysis

Outlet segmentation provides the geographic and format context behind the sales total.

SEGMENT	SALES	SHARE	LOCATION TIER	SALES	SHARE
Small	\$248.99K	20.7%	Tier 1	\$336.40K	28.0%
Medium	\$507.90K	42.3%	Tier 2	\$393.15K	32.7%
High	\$444.79K	37.0%	Tier 3	\$472.13K	39.3%

Establishment trend :

The line chart in the supplied dashboard shows a visible peak around 2018 (~\$205K), with lower values before and after the peak. This makes establishment year a useful lens for understanding outlet maturity and network evolution.

Interpretation: medium outlets are the largest displayed size segment, while Tier 3 locations contribute the largest location-tier share. The pattern supports comparing store format and location economics together rather than viewing either dimension in isolation.

07 Outlet-Type Performance

The outlet matrix combines sales,itemcount,averagesales,rating and item visibility.

OUTLET TYPE	TOTAL SALES	NO. ITEMS	AVG SALES	AVG RATING	ITEM VISIBILITY
Grocery Store	\$151.94K	1,083	\$140	4.0	0.10
Supermarket Type1	\$787.55K	5,577	\$141	4.0	0.06
Supermarket Type2	\$131.48K	928	\$142	4.0	0.06
Supermarket Type3	\$130.71K	935	\$140	4.0	0.06

Key observation: Supermarket Type1 is the dominant displayed outlet format at approximately \$787.55K, or 65.5% of the shown sales mix. Its item count is also substantially higher than the other outlet types, so the format should be examined for both scale effects and repeatable practices.

Operational lens: the matrix is particularly useful because the same outlet can be assessed on revenue, assortment volume, average sales, customer rating and item visibility instead of sales alone.

08 Dashboard Architecture & User Flow

The supplied dashboard is structured as a left-to-right decision path.

FILTER	Outlet Location Type Outlet Size Item Type
KPI STRIP	Total Sales Avg Sales No. of Items Avg Rating
ANALYSIS	Fat Content Item Type Outlet Establishment
SEGMENTATION	Outlet Size Outlet Location
DETAIL	Outlet Type matrix Item Visibility

User journey: filter the business slice → read headline KPIs → identify the strongest product/outlet segments → inspect location and size patterns → validate the detailed outlet-type matrix → move from observation to an action.

09 Key Insights From the Supplied Dashboard

These are descriptive findings from the displayed dashboard values; they are not forecasts.

01	Revenue is concentrated in regular-fat products. Regular-fat sales are approximately \$776.32K, versus \$425.36K for low-fat products.
02	Medium outlets form the largest size segment. Medium outlets contribute about \$507.90K, ahead of high and small outlets.
03	Tier 3 locations contribute the largest location-tier share. Tier 3 sales are approximately \$472.13K, representing about 39.3% of the displayed mix.
04	Supermarket Type1 dominates the outlet-format mix. Its displayed sales are about \$787.55K, substantially above each other outlet type.
05	Sales are led by a small set of item categories. Fruits & Vegetables and Snack Foods are both shown at roughly \$0.18M.
06	The establishment trend contains a clear peak. The dashboard shows the highest displayed establishment-year value around 2018 at roughly \$205K.

10 Actionable Recommendations

Suggested next steps are framed as analytical actions rather than assumptions about the underlying business.

ACTION	HOW TO USE THE DASHBOARD
Prioritize the dominant outlet format	Use Supermarket Type1 as a benchmark and compare its assortment, visibility and sales productivity with other outlet formats.
Investigate product-mix concentration Use	Break down regular-fat and leading item categories by outlet size, location tier and establishment year to identify where the mix is strongest.
location tiers for targeted review Review	Compare Tier 3 vs Tier 1/2 outlets on average sales, item count, visibility and rating to identify operational differences.
the 2018 establishment peak Turn item	Check whether the 2018 spike reflects outlet expansion, a format mix change, demand conditions or another structural factor in the source data.
visibility into an operational KPI Build a	Track low-visibility, high-sales and low-sales combinations to identify potential assortment or shelf-availability issues.
repeatable performance cadence	Use the dashboard filters for periodic outlet reviews and add time-based comparisons as more dated data becomes available.

Recommended operating rhythm: start with the KPI strip, isolate an outlet/location segment, compare product mix, then drill into outlet type and visibility before deciding what to investigate operationally.

11 Technical Implementation Summary

The supplied PBIX uses native PowerBI visuals,measures and interactive filters to support the report.

COMPONENT	IMPLEMENTATION OBSERVED IN PBIX
KPI cards	Total Sales, Avg Sales, No Of Items, Avg Rating
Slicers	Outlet Location Type, Outlet Size, Item Type
Donut charts	Sales by Item Fat Content; Sales by Outlet Size
Bar charts	Sales by Item Type; sales by outlet/location segment
Line chart	Total Sales by Outlet Establishment Year
Funnel	Sales by Outlet Location Type
Matrix / pivot	Outlet Type with Sales, Items, Avg Sales, Avg Rating, Item Visibility
Metric selector	Metrics field parameter supports KPI switching in selected visuals

Technical takeaway: the report is intentionally built around reusable measures and dimensions, making it suitable for interactive exploration rather than a static one-time chart pack.

12 Dashboard Preview

Final dashboard view supplied with the project.The preview is included for reference at the end of the report.
